## Saitilitles Isanities

More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline at (800) 426-4791, or via the web at www.EPA.gov.

For maintenance concerns or questions about hydrants, taps or mains, call the water utilities operations facility at 317-733-2855.

If you have any questions about this report or concerning your water utility, please contact Carmel Utilities at 317-571-2443 or go to the Utilities page on the City of Carmel website at ww.carmel.in.gov

**Questions?** 

Educates people and inspires action to ensure sustainable, clean groundwater for future generations.

Groundwater Guardian

Awarded to communities who go sbove and beyond the state's requirements for protecting their drinking water supply.

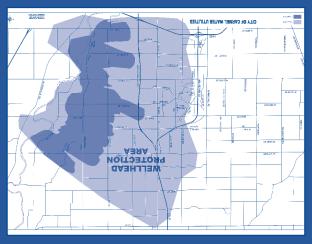

Hoosier Water Guardian Award

to protect groundwater.

Most people do not realize the impact they can have on groundwater. Anything poured or spilled onto the ground's surface can potentially end up in the groundwater supply and remain there for years. Pesticides, fertilizers, road salt, used motor oil, untreated waste from septic tanks, and toxic chemicals from underground storage tanks can all seep into groundwater. Every individual has a responsibility

Wellhead protection prevents contaminants from entering areas that contribute water to the public water supply. The wellhead protection areas are determined by geologic and hydrologic criteria such as the physical characteristics of the aquifer and the effects that pumping has on the rate and direction of groundwater movement.

#### **Our 3-Step Water Treatment Process**

1) Iron Removal The water treatment plant aerates the water to oxidize the soluble iron found naturally in well water. The oxidized iron adheres to itself forming clumps that are filtered out of the water by iron filters.

2) Water Softened Then, the iron filtered water passes through a process where the water is softened to 8 grains hardness, which is considered moderately hard water. Should you desire water that has been softened to zero (0) grains hardness, a home softener will be needed. During periods of extremely high summer water usage, the level of softening may be decreased to meet customer demand.

**3)** Chlorine and Fluoride Added Chlorine is added to destroy any harmful bacteria present and to maintain a level of protection as the water travels through the distribution system. Fluoride is added to help strengthen resistance to cavities in teeth. Following the injection of chlorine and fluoride, the water enters the distribution system to be delivered to Carmel's homes and businesses.

#### **People with Compromised Immune Systems**

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

#### **Lead in Home Plumbing**

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Carmel Utilities is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components.

When your water has been setting for several hours, you can minimize the potential of lead exposure by flushing your tap for 30 seconds to 2 minutes before using the water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested.

Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

### Water Purity INFORMATION PROVIDED BY UNITED STATES ENVIRONMENT PROTECTION AGENCY

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances.

All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk.

More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at (800-426-4791).

#### **Water Contaminants before Treatment**

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, storm water runoff, and residential uses.
- Organic chemicals, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- Radioactive materials, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

## **2014 WATER QUALITY RESULTS**

Carmel Utilities routinely monitors for constituents in your drinking water according to Federal and State laws. This table shows the results of our monitoring for the period of January 1st to December 31st, 2014.

As water travels over the land or underground, it can pick up substances or contaminants such as microbes, inorganic and organic chemicals, and radioactive substances. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily pose a health risk.

#### **DEFINITIONS**

**AL (Action Level)** – The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

BDL (Below Detectable Limits) – laboratory analysis indicates the constituent is below detectable limits of the instruments and methods used to detect this constituent.

**NA** (Not Applicable) – not required to test for this constituent during the 2014 calendar year.

**ND (Non-Detects) -** laboratory analysis indicates that the constituent is not present.

**PPM (Parts per million) -** one part substance per million parts water (or milligrams per liter)

**PPB (Parts per billion) -** one part substance per billion parts water (or Micrograms per liter)

**pCi/L ( Picocuries per liter) -** picocuries per liter is a measure of the radioactivity

mrem/yr ( Millirems per year) - measure of radiation absorbed by the body.

NTU (Nephelometric Turbidity Unit) – nephelometric turbidity unit is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person

**IT (Treatment Technique)** - A treatment technique is a required process intended to reduce the level of a contaminant in drinking water.

MCL (Maximum Contaminant Level) The "Maximum Allowed" (MCL) is the
highest level of a contaminant that is
allowed in drinking water. MCLs are set
as close to the MCLGs as feasible using
the best available treatment technology.

MCLG (Maximum Contaminant Level Goal) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

MRDL (Maximum Residual Disinfectant Level) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

MRDLG (Maximum Residual Disinfectant Level Goal) – The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

We are pleased to report that your tap water met all Environmental Protection Agency (EPA) and state standards in 2014.

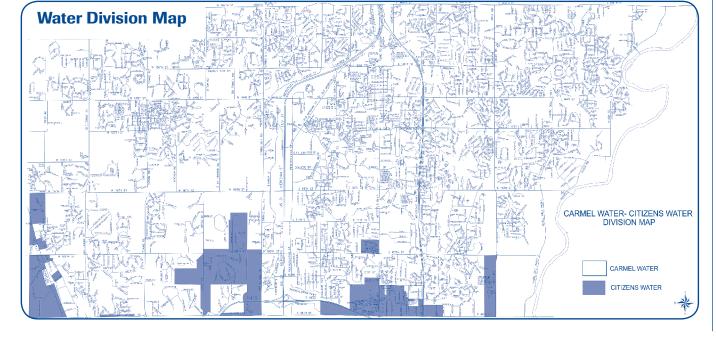

UNTREATED SOURCE WATER DATA	CARMEL WATER UTILITY Plant 1 White Fall T.W. V Flow Splitting Bldg. River Creek Moses Riv					
Cryptosporidium (org/10L)	<0.044-<0.062	1.2	<1	<1	<1

TOC (ppm)	NA		3.7	' (2.3-8.1)	)	

Testing for Cryptosporidium Cryptosporidium is a microscopic organism that lives in the intestines of animals and people. When ingested this microscopic pathogen may cause a disease called cryptosporidiosis, which has flu-like symptoms. Although there has been no cryptosporidium found in treated, finished drinking water, cryptosporidium is found in source water such as White River, Fall Creek and Eagle Creek Reservoir. The U.S. EPA has created the Long Term 2 Enhanced Surface Water Treatment Rule (LT2) for the sole purpose of reducing illness linked with the contaminant Cryptosporidium and other disease-causing microorganisms in drinking water. The rule will bolster existing regulations and provide a higher level of protection of your drinking water supply.

#### **Carmel's Water Supply Source**

Carmel's water supply comes from a ground water source called an aquifer. The aquifer is commonly referred to as the Upper White River Basin Watershed. Eighteen wells located throughout the city pump water from the aquifer

to five water plants for treatment. The production wells range in depth from 49 to 108 feet deep, are 10 to 36 inches in diameter, and have pumping capacities ranging from 175 to 2,800 gallons per minute.

# **Source of Carmel Clay's water supply that comes from Citizens Water**

White River supplies two of the four surface water treatment plants:

- 1. White River and White River North
- **2.** Morse Reservoir, near Noblesville, stores water to assure a dependable supply in the White River to these plants.
- 3. Fall Creek is another surface water supply.
- **4.** Geist Reservoir stores water to assure and adequate supply in Fall Creek for the Fall Creek Treatment Plant.

A number of wells are used intermittently to supplement the supplies to the White River, White River North, and Fall Creek plants. Citizens Water also receives some surface water from Eagle Creek Reservoir which supplies water to the T.W. Moses plant.

Currently Citizens Water has four groundwater stations that serve smaller portions of its service area. These are Geist Station, Harding Station, South Well Field, and Ford Road Plant. These groundwater stations treat water pumped from underground water sources called aquifers.
